

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge? Me personally i did the same project last year, so I knew what I was getting into and felt confident about it
Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion? At first I got confused on how to set up all the coins, so the computer knows how much each coin is worth, but I figured it out, and went on my old project to check it out to see what I did wrong

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding? I Kinda had a plan, if I got confused or stuck, I could check my work from last year and see what I did wrong, and work on there.
How did you decide on the tools, data structures, or algorithms to use? I kinda already knew what I was doing at first, but if I ever got stuck, I would use my old project as a tool, and see what I did wrong

Implementation

Did you write the code in small pieces or attempt the entire solution at once? I broke the code up into pieces, and took it step by step, to make sure I could find a problem quicker
How did you test your solution along the way to make sure it was working? I tried plenty of different numbers to see if it would work or not, but all the ones I tried worked perfectly

Overcoming Challenges

What part of the problem was the most difficult for you? Definitely setting up the coins, and basically telling the computer that a quarter is 0.25.
How did you handle moments when you felt stuck or unsure of what to do next? I stayed calm and talked to the people around me for help, or used my last year project to help me if I got stuck

Learning

Was there anything you learned that you think will help you with future challenges? Little things like adding ";" at the end of each code line.
